

XML Label Printing for Dynamics NAV

Benefits:

Zebra Designer for XML provides visual way of setting up labels fast and easy. Font size and Barcode widths are auto adjusted based on the length of the variable.

Simple Mapping Tool allows mapping any table into the label variable with the ability to setup hierarchical table linking.

Field manipulation functions within the Mapping Tool allow combining multiple fields into a single variable, coding fields, using different formats.

ZPL Template is stored in Printer Memory. Only a small xml file gets transmitted to the printer - this guarantees faster printing.

ZPL Template can be mapped to different sources. This allows printing identical labels from different parts of the system using a single label design.

Zebra Designer for XML allows the user to create ZPL label templates for different printers from the same source label. The label can be printed to any printer with only one setup of mapping.

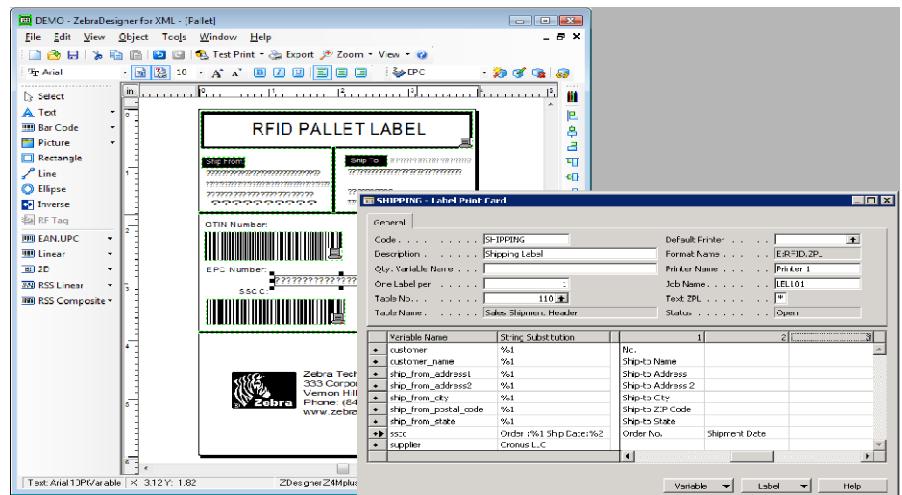

Print from any place in the system. The label can be printed from any form, report or codeunit by single call of the universal function.

XML Label Mapping Tool

The XML Label Mapping tool for Dynamics NAV provides for printing industry standard labels and tags directly from Navision to any printer that supports XML printing. The tool can be used with the “Zebra Label Designer for XML” or any other label design software that supports Zebra’s XML technology. The XML Label mapping tool can be used with any tables within Dynamics NAV and supports hierarchical table linking.

Zebra Designer for XML

Labels can be visually designed using Zebra’s designer for XML. ZPL templates can be stored within NAV’s system. All of the label variables will be automatically recognized and decoded into an easy to use mapping tool that allows the user to set up rules for the label data that has to be printed. The same label can be printed from many sources by simply mapping label variables into the Dynamics NAV table structure.

Save Time Designing and Printing Labels

Zebra XML label printing technology is the fastest and easiest way to print labels in the mass distribution environment. Zebra Label Designer for XML combined with the XML Label Mapping Tool for Dynamics NAV allows a user to create industry standard labels or RFID tags without any coding. All design and mapping is done with easy to use visual tools and requires minimal training. ([See animation explaining Zebra XML Technology](#))

Features

| | |
|-----------------------------|---|
| Zebra Label Designer | Visual label design tool Single Label Design for Multiple Labels Easy upload label template to the printer memory Supports all XML enabled Zebra Printers |
| Label Mapping Tool | Visual mapping of any table and field within Dynamics NAV Ability to Link Tables Ability to combine multiple fields into one variable using template Ability to use different field formats Import ZPL template and auto create label structure |
| Other Features | Ability to print label from any form based on the users selection Ability to print from any report Self Study training materials and videos |
