

Product Modeling & Load for Microsoft Dynamics NAV

*Send data from a CAD system, configure to production data,
and then create master data automatically in Dynamics NAV*

NAVEKSA

NAVEKSA's Product Modeling & Load System (PML) is used as:

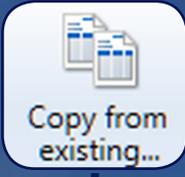

A time-saving and quality assurance system in the process of converting CAD system data to production data, including automatic creation of products, BOM's and process data in the Dynamics NAV system.

Advantages with NAVEKSA PML:

Consistency and coherence of data in an intuitive way. Transparent and easier management of technical product- and production data. Fewer errors in production. Shorter lead time from design to production.

Import data from
AutoCad
Solidworks
SolidEdge
Inventor
 a.o.

Read data from NAV

Notes
[Click here to create a new note.](#)

Different color codes and clear leveling makes the work easy for the user to structure and achieve the desired result.

MAIN FEATURES:

You can create items, BOMs and associated routings in multiple levels in the same operation.

The overview is maintained as the user can always see the product structure of the modeling performed.

New items, BOMs and routings are automatically created in NAV on the basis of pre-defined templates. Version control is supported.

Import of data is parameter driven and requires no additional programming.

The PML system recognizes existing products, BOM lists and routings in the NAV system. New products, BOMs and routings are created automatically in Dynamics NAV.

Existing BOMs and routings in NAV can be copied in and modeled for new products in PML, which then can be created automatically in Dynamics NAV.

All designs are managed under a unique ID number that can be used later as a historical reference.

Ability to manage identical items that differs slightly, for example. post-treatment, in the form of coatings etc.

THE WAY FORWARD?
