

# ENHANCE

Microsoft Dynamics NAV

## 3.7 to 5.0 Feature Enhancements

Microsoft Dynamics™ NAV 3.7 to Microsoft Dynamics NAV 5.0

The following document describes the enhancements to the 3.7 version that are included in the 5.0 version of Microsoft Dynamics NAV. The enhancements are categorized by granule ID. This will aid partners in the upgrade process when showing customers the new features added to granules they have already purchased.

Date: July 2007

## **General Ledger**

### 3010 Basic General Ledger

#### Reversal of Journal Postings

Users can automatically create reversal entries to reverse the following:

- Ledger entries created from lines manually entered in journals.
- An entire G/L register of ledger entries created from journal lines.

Related entries, for example VAT entries, are also reversed. There is a clear audit trail linking the journals reversed and the matching reversal entry.

Depending on the functionality that the customer has purchased, the journals that can be reversed include:

- General Journals
- Cash Receipt Journals
- Payment Journals
- Sales Journals
- Purchases Journals
- Fixed Asset Journals
- Maintenance Journals

#### Standard General Journals

A function has been added to the General Journal that supports the ability to save journal lines as standard journal lines as well as to retrieve the saved journals, for example, a payroll journal, a recurrent journal of various expenses, and so on. This is a simpler alternative to the recurring journals that does not require allocations; however, standard general journals do not allow automatic reversing.

#### Master Data Import

A form has been added to the Industry Template features allowing an easy interface to export the format of the table data structure to an Excel file and to import master data after it has been entered in the correct format in the exported Excel spreadsheet.

#### Three New Reports:

- The Fiscal Year Balance report shows the closing balance until the end of the previous fiscal year for each ledger account, the fiscal year until this period, this fiscal year until the end of the selected period (or alternate ending date), the balance until the end of the selected period (or alternate ending date), excluding the closing entries.
- The Balance Comparison – Previous Year report is an overview of the GL Account with information about the current period, the balance at the end of the period (YTD, end of period or alternate ending date), the balance in the same period from the previous year and the balance (YTD, end of period or alternate ending date) of the previous year.
- The Trial Balance by Period report shows the opening balance by ledger account, the movements in the selected period (month, quarter or year), and the resulting closing balance.

### SMTP – Simple Mail Transfer Protocol

This feature has been added to support the SendMail operation from the Microsoft Dynamics™ NAV Service. It supports the native operating system method to manage SendMail from Microsoft Dynamics NAV.

### Online Map

This feature demonstrates how Microsoft Dynamics NAV can integrate with other Microsoft products, for example, Microsoft® MapPoint. The online map functionality shows a location on a map and also enables you to get directions from one location to another. Through integration with an online map, we empower the user by offering extended address features with Microsoft Dynamics NAV.

### Document Approval

This feature introduces an approval process for sales and purchase documents which includes:

- Ability to approve and reject documents with comments
- Ability to delegate approval to another
- SMTP mail notification to approvers and overdue-approval notifications

### Prepayments

Prepayments allow the user to create one or more prepayment invoices based on a sales or purchase order. The prepayment can be either a set amount or a percentage of the total invoice. The system keeps track of created prepayment invoices until the order is fully invoiced.

### Integration with Microsoft® Office

This new functionality consists of two features:

- Export Using Office XML – A generic solution that allows the user to export data from any form in Microsoft Dynamics NAV using the new Office XML format. Additional style sheets can be defined by the partner or customer.
- Record Links - A generic solution that allows the user to add links to documents to any record in Microsoft Dynamics NAV. The documents can be stored in SharePoint or on a fileserver.

### Rapid Implementation Methodology (RIM)

Rapid Implementation Methodology (RIM) is primarily designed for new customers, but it can also be useful to an existing customer who is adding modules to their installation. RIM reduces the implementation workload by streamlining the repetitive tasks any implementation requires.

RIM contains the following components:

#### *Industry-Specific Information*

- Implementation Questionnaire
  - The Implementation Questionnaire is a collection of industry-specific questions and suggested answers to update the contents of Microsoft Dynamics NAV setup tables (for example, tables 79, 98, 311, 312, 313, and so on.) The questionnaire guides the user and the implementation consultant through the Microsoft Dynamics NAV setup requirements from a business perspective, to insure that the setup reflects the customer's business rules.

- The Implementation Questionnaire (in XML or Excel format) serves as a valuable and understandable documentation of the setup decisions.
- Setup Data
  - RIM contains standard, industry-specific setup data that has been created by industry specialists with experience from many implementation projects. Reusing common data saves implementation time and makes a more industry-specific setup possible.
- Master Data Templates
  - To optimally use Microsoft Dynamics NAV, you need valid information in the master data records. RIM includes industry-specific master data templates.
  - RIM contains five versions of predefined templates for each predefined master data type: Contacts, Customers, Vendors, and Items.
  - Master data templates can also be used in daily operations. If the functionality is implemented, you only have to enter, for example, the item description (the program provides the item number automatically – depending on the setup) and then apply the appropriate template; and the mandatory fields are correctly copied from the template to the actual master data record.
  - Partners can easily apply the master data template functionality to any master data table in Microsoft Dynamics NAV.

#### *Batch Creation of Journal Lines*

- The Batch Creation of Journal Lines functionality allows you to create a number of journal lines with predefined information, so the user only has to enter a few pieces of missing information (for example, amounts).

#### *Predefined User Permissions (covers only the Microsoft Dynamics NAV core solution)*

- The predefined Microsoft Dynamics NAV user permissions cover the permission necessary to carry out work for seven archetypes of users in Microsoft Dynamics NAV.
- The selected archetypes are:
  - Production Manager
  - Shipping & Receiving Clerk
  - Order Entry Clerk
  - Purchasing Agent
  - Accountant
  - Accounts Receivables Clerk
  - Accounts Payable Clerk

#### Payment Terms Translation

Payment terms and shipment methods have been enhanced so that the customer can now define translations for payment terms and shipment methods. For customers with Multilanguage, this means they can ensure that the shipment method and payment terms on an invoice will appear in the correct language.

## 3050 Consolidation

To comply with SFAS52/IAS21 in relation to foreign currency translation, customers can now choose which method to use when translating a specific G/L account from a foreign entity. You simply select the appropriate Consol. Translation Method for each individual G/L account.

Customers can now translate a foreign entity's financial statement using the following methods:

- Average Rate (manual) – the average rate for the period to be consolidated. You calculate the average either as an arithmetic average or as a best estimate and enter it for each business unit.
- Closing Rate – the rate which prevails in the foreign exchange market at the date for which the balance sheet or income statement is being prepared. You enter the rate for each business unit.
- Historical Rate – the rate of exchange for the foreign currency which prevailed when the transaction took place.
- Composite Rate – the current period amounts are translated at the average rate and added to the previously recorded balance in the consolidated company. This method is typically used for retained earnings accounts because they include amounts from different periods and are thus a composite of amounts translated with different exchange rates.
- Equity Rate - similar to Composite. The posting of the differences will be to separate G/L Accounts.

You can also choose whether the currency exchange rates from the business or the consolidating companies will be used. If customers want to consolidate using pre-4.0 methods, they can do this by selecting Average Rate (the default) as the Consolidation Translation Method for all accounts. This will translate income statement accounts using the average rate, balance sheet accounts using the closing rate and restate balance sheet accounts using the last closing rate.

Changed Consolidation File Import/Export foundation - Consolidation files are now in XML format. The TXT format is still supported, letting customers create and import TXT formatted files.

## 3070 Basic XBRL

The XBRL functionality has been updated to enable specification 2.1 reporting. In addition, the following improvements were made:

- Update of the XBRL whitepaper
- Annotations to each taxonomy are now versioned
- Comments on each taxonomy are now versioned

## 3090 Intercompany Postings

Intercompany Postings is new functionality that helps customers create and distribute inter-company transactions between multiple Microsoft Dynamics NAV solutions and across multiple companies.

- Customers can create all the necessary documents – sales and purchase documents, general ledger entries and more – for the entire workflow, for more than one company at a time. Intercompany Postings allows for multiple databases, multiple currencies, different charts of accounts and multiple languages.

- Customers can make the correct due to/due from entries in more than one company, using relevant intermediary accounts. Transactions referring to another set of books within the same group of legal entities can be entered directly in the GL or when entering sales and purchase documents.

**Please note that Intercompany Postings is not a consolidation solution.**

The target market for Intercompany Postings functionality is businesses with complex business processes and a strong need for a vertical focus. They are frequently businesses in wholesale, manufacturing and those that provide other business services, from super-user to one-person IT staff.

Intercompany Postings includes functionality for distribution of purchase invoice costs to partner companies.

It is not unusual within the mid-market for holding companies to be formed to create a greater synergy amongst like companies. These holding companies consolidate accounts receivable (A/R) and accounts payable (A/P) processes across the organization resulting in savings in overall costs. Bills received from vendors are distributed for all subsidiaries across the organization.

Secondly, spokes within the Hub'n Spoke structure are invoiced by vendors and recorded costs need to be spread across the organization.

### 3810 Job Queue

The Job Queue replaces the Job Scheduler (from the Service Module). The functionality has been enhanced, so it is now possible to setup jobs for both code units and batch jobs, as well as for areas outside the Service Module. For instance, Outlook Integration uses the job queue when requesting synchronization.

A job can be a one-time request or it can be set up as a recurring job at a specified interval. When jobs are created, the application server monitors the Job Queue and runs the entries in a prioritized order.

### 5010 Bank Account Management

#### Void Check

The granule has been updated to allow the user to void checks from the Check Ledger Entries window. The user can choose whether to unapply the underlying bank ledger entry and the corresponding general ledger (G/L) entries or just reverse the entries. The user can select a specific posting date for the voiding.

## ***Sales and Receivables***

### 3260 Basic Receivables

#### Partial Payments

Improved flexibility in applying cash receipts - Microsoft Dynamics NAV provides the ability to decide how a payment is applied, which gives greater flexibility in using the solution. This includes:

- Selecting the specific amount to apply to individual documents in a multiple document application.
- Viewing information about both the applying entry and the application in a single form.

- More detailed information about the amounts that will be posted to the GL prior to posting such as payment discounts and rounding amounts.

#### Unapply

It's possible to reverse all postings and changes related to an application of customer ledger entries. Unapplied entries are set as open entries so that they can be applied again correctly.

#### Payment Terms Translation

An enhancement has been made so that the customer can now define translations for payment terms and shipment methods. For customers with Multilanguage, this means that the data on an invoice will appear in the correct language.

### 3270 Sales Invoicing

#### Information Pane on the Sales Invoice

A new pane containing:

- Instant access to and a good overview of the customer's sales history, available credit and shipping and contacts information.
- Information about item availability, substitutes, prices and discounts are contained in a single view, which makes it easy to provide quick answers to customer questions.
- Invoice entry is expedited through, for example, a "copy to document" function directly from the **Sales History** window.

In the **Sales and Receivables Setup** window, you can indicate if a logo should be added to the sales invoice and where (left, center, right) it should be added. The logo will then be printed on the document. The logo is captured as a bitmap in the company information setup window.

### 3280 Sales Order Management

#### Information Pane on the Sales Order

A new pane containing:

- Instant access to and a good overview of the customer's sales history, available credit and shipping and contacts information.
- Information about item availability, substitutes, prices and discounts are contained in a single view, which makes it easy to provide quick answers to customer questions.
- Order entry is expedited through, for example, a "copy to document" command directly from the **Sales History** window.

In the **Sales and Receivables Setup** window, it is possible to indicate if a logo should be added to the sales quote, order confirmation and sales shipment and where (left, center, right). The logo will then be printed on the documents. The logo is captured as a bitmap on the company information setup.

#### Work Order

A Work Order report has been added as an additional option on the print button of the sales order. The work order presents a table where the user can manually enter possible changes to the sales order prior to delivering it back to a registering clerk.

#### Prepayments

Prepayments allow the user to create one or more prepayment invoices based on a sales order. The prepayment can be either a set amount or a percentage of the total invoice. The system keeps track of created prepayment invoices until the order is fully invoiced.

### 3350 Sales Return Order Management

#### Costing

This granule was affected by the enhancements to the Costing functionality. See the description of the costing functionality in the Basic Inventory granule.

## ***Purchases and Payables***

### 3510 Basic Payables

#### Partial Payments

*Improved flexibility in Applying Cash Payments* - Microsoft Dynamics NAV provides the ability to decide how a payment is applied, which gives greater flexibility in using the solution. This includes:

- Selecting the specific amount to apply to individual documents in a multiple document application.
- Viewing information about both the applying entry and the application in a single form.
- More detailed information about the amounts that will be posted to the GL prior to posting such as payment discounts and rounding amounts.

*Unapply* - It's possible to reverse all postings and changes related to an application of vendor ledger entries. Unapplied entries are set as open entries so that they can be applied again correctly.

#### Payment Terms Translation

An enhancement has been made so that the customer can now define translations for payment terms and shipment methods. For customers with Multilanguage functionality, this means that the data on an invoice will appear in the correct language.

### 3530 Purchase Order Management

#### Prepayments

Prepayments allow the user to create one or more prepayment invoices based on a purchase order. The prepayment can be either a set amount or a percentage of the total invoice. The system keeps track of created prepayment invoices until the order is fully invoiced.

### 3570 Purchase Return Order Management

#### Costing

This granule was affected by the enhancements to the Costing functionality. See the description of the costing functionality in the Basic Inventory granule.

## ***Inventory***

### **4010 Basic Inventory**

Work-In-Process (WIP) account is cleared upon finishing and adjusting production order

Even though related purchased/produced components have not been invoiced, a finished production order can now be adjusted (invoiced) with the effect that production cost values are moved from the WIP account. In principle, this implies that the WIP account now only contains costs associated with released production orders. This modification applies to all costing methods.

#### **Standard Cost Revaluation**

Revaluation of expected (not yet invoiced) inventory valued at standard cost is also possible - As the new – revalued – standard unit cost will now apply to item purchase/production entries that are invoiced as well as those that have not been invoiced. Also the Interim Inventory account will assume the updated item costs. For the end users this means that they do not have to get purchases/production (inbound transactions) invoiced prior to standard costed item revaluation or use other workarounds.

Cost adjustment process can now be performed in real time

Users can now choose to perform cost adjustment and item unit cost update in real time. This means that adjustments – forwarding cost changes from inbound to outbound entries – can happen when:

- Posting inbound transactions (and outbound, in the case of average costing method)
- Posting item charges
- Changing production order status to finished
- Posting revaluation, as opposed to doing it in a batch job

The last option provides users with the advantages of operating with accurate inventory cost values, and thus profit calculations, without having to rely on co-workers in Finance to run the adjustment routine periodically. In those operational environments with complicated costing flow, where real-time cost updating may cause a potential decrease in performance, the users will still have the option of running some or all adjustments in the batch job.

#### **Standard Item Journals**

On the Item Journal a function has been added in order to support the ability to save journal lines as standard journals as well as to retrieve the saved journals.

#### **Costing**

The costing functionality has been redesigned and the improvements can be grouped in two categories:

- Improving UI designs of the existing costing framework
- Enhancing costing framework with better facilities for decision making

#### **Features:**

##### ***Costing Data Trustworthiness***

- Cost update on the sales/customer statistics

- Inventory Period Closing feature
- Corrected principles behind cost adjustment batch job

#### *Traceability*

- Re-visited principles behind posting inventory value entries to G/L
- New reporting tool for G/L Inventory reconciliation
- New reporting tool for item value dynamics

#### *Simplicity and Usability*

- Improved cost reversal (returns) process-support
- Resilient costing-related batch jobs
- Possibility to un-do item entry application
- Simplified costing setup on the item card

#### *New*

- Periodic average costing method

### Planning Transparency

From the "Untracked Quantity" field on the Order Tracking window, it is now possible to drill down to a form that lists the various supply lines that generate the untracked quantity.

### Item Tracking

The Basic Inventory granule was affected by enhancements to the Item Tracking functionality, which is described in the following.

## 4140 Item Tracking

### Item Tracking

The Item Tracking functionality has been enhanced as follows:

- New traceability feature (the Item Tracing window) allows the user to quickly identify where Lot or Serial numbers have been sold or bought. The Navigate window has also been enhanced.
- Enhancements of the Item Tracking assignments when selecting, allocating or counting them.
- A First Expired First Out (FEFO) criterion for the flow of goods has been implemented throughout the system.
- Several reports have been created or enhanced.

## 4230 Analysis Reports

### Sales and Purchase Analysis Reports

The Analysis Reports functionality enables users to create customized reports based on records of their posted transactions, for example, sales, purchases, transfers and inventory adjustments. In a customizable report, the source data, which is derived from the item ledger (with associated value entries), can be combined, compared and presented in meaningful user-defined ways. In this sense, the analysis report is very similar to a PivotTable report in Microsoft Excel.

For example, customers can create a personalized report that focuses on their key customers in terms of total turnover both in amounts and quantities sold, gross profit and gross profit percentage during the current month, and have it compare those figures with the results from previous months or the same month last year, and calculate deviations. All this can be done in one and the same view, with the possibility to navigate to the cause of the identified problem by drilling down to the level of individual transactions.

The look and feel of the Sales and Purchase Analysis report is similar to the Account Schedule features offered in the General Ledger area of Microsoft Dynamics NAV.

#### Sales and Purchase Analyses by Dimensions report

Enables users to analyze sales amount, COGS, purchase cost and item sales and purchase quantities.

You can:

- Quickly change the information to show in the columns and lines in the analysis.
- Analyze on specific items and periods.
- Analyze on specific customers and vendors (Requires Granule 3260 and/or 3510)
- Analyze on specific locations (Requires Granule 4045)
- Analyze on dimensions (Requires at Granule 4760 as a minimum).
- Export your analysis to Microsoft Excel.

The look and feel of the Sales and Purchase Analyses by Dimensions is similar to the Analysis by Dimensions features offered in the General Ledger area of Microsoft Dynamics NAV. Note that you must purchase Granule 4010 Basic Inventory before you can use this granule.

#### 4240 Item Budgets

Item Budgets enables users to create Sales and Purchase Budgets that can be:

- Entered in terms of monetary values (Sales, COGS, Cost) and Quantities.
- Created for specific items and periods.
- Exported to and imported from Microsoft Excel.
- Created for specific customers and vendors (Requires Granule 3260 and/or 3510)
- Created for specific dimensions (Requires at Granule 4760 as a minimum).

The look and feel of the Sales and Purchase Analyses by Dimensions is similar to the G/L Budget features offered in the General Ledger area of Microsoft Dynamics NAV. Note that you must purchase Granule 4010 Basic Inventory before you can use this granule.

#### 4640 Automated Data Capture System

The Automatic Data Capture System (ADCS) is used as a primary tracking system for movement of goods on the warehouse floor. This has been improved in version 5.0. The connection between the VT100 Plug-in handheld (a handheld device to scan bar codes on goods) and the Application Server for Microsoft Dynamics NAV has been simplified using TCP Sockets. This makes the feature more stable.

## ***Jobs***

### **4510 Jobs**

The entire Jobs feature area has been redesigned and improved to provide a better foundation for partners. At the core of the new Jobs module lies the new budget structure made up of job task and planning lines. The task and planning lines now replace the phase, tasks and steps you might know from previous releases. Job task lines are now mandatory, meaning that at any point an itemized overview of the job can be viewed from the job task lines window.

In the new task lines window, you can drill down to view values generated by the underlying job planning lines. These planning lines are used to generate itemized sales invoices directly from the job.

Furthermore, the following improvements have been made:

- Handling of fixed price projects by separation of amounts into schedule (budget), usage and contract (sales), which can be selected in the job planning lines.
- Five new WIP calculations based on IAS standards have been added, which can be recalculated and reposted for part or all of a job.
- Better integration to item ledger and item tracking.
- Job-based pricing for items, resources and G/L accounts.
- Foreign currency functionality that gives users the option to plan in their local currency and bill in a customer's foreign currency or Plan and bill in a customer's foreign currency.
- Copy job functionality.
- Two new reports have been created.

## ***Marketing and Sales***

### **5160 Interaction/Document Management**

#### **Postponed Interaction Log Entries**

The granule has been enhanced to provide the possibility to save an interaction during the process and later reopen and continue.

### **5190 Outlook Client Integration**

- Digital Security Certificate
- Two-way synchronization of all fields
- Grouping Outlook tasks
- Synchronization of Team to-dos/restructuring of Team to-dos

### **5195 Outlook Client Integration**

The existing CRM solution has been strengthened by adding integration to Microsoft® Office Outlook®, with the following features:

- **Default Synchronization Setup** - Microsoft Dynamics NAV delivers an out-of-the-box synchronization schema for contacts, to-dos and appointments. Data can be synchronized bi-directionally or one-way.
- **Synchronization Based on User Preferences** - Outlook users can define custom filters for data to synchronize. The security context is controlled from the back end system.
- **Synchronization with Custom forms** - The default synchronization schema can be adjusted or new schemas can be created.
- **Outlook Integration** - supports synchronization with any Outlook object and any table entity in Microsoft Dynamics NAV.
- **Disconnected Users** - The Outlook client communicates directly with the server for Microsoft Dynamics NAV and no client for Microsoft Dynamics NAV is required.

## ***Service***

### **5911 Service Order Management**

#### **Service Order Handling**

The design of the Service module has been aligned with the design of the other modules of the application. The following areas have been standardized and aligned with other areas of the application:

- Integration with item tracking, jobs and costing.
- Handling of inventory consumption for outbound service. Improvements have been made to: predefinition of consumption, handling of actual consumption (inventory) and how to determine what is to be invoiced to the customer and what is consumption.
- Posting of a service order (sales of spare parts and service order closing and invoicing) with the following shipping options: ship, consume, invoice, and ship and invoice.

## ***Manufacturing***

### **5410 Production Orders**

#### **Easy Production Reporting**

This feature allows users to record consumption and output from the context of a production order line. The Production Journal window combines the functions of the consumption journal and the output journal into one journal, which is accessed directly from a released production order line. When the journal is opened, it is preset with the expected or remaining (by partial posting) quantities or times to be recorded – both output and consumption.

When using routing link codes, the consumption lines (components) will be indented under the linked output lines (operations) thus providing a nice process overview. Quantities and times already recorded for the production order line are displayed at the bottom of the journal as actual entries.

## Planning Resiliency

You can now run the planning batch job in a fault tolerant mode. This allows a supply plan to be created even if some preconditions for the calculation are not met. Instead of stopping the calculation the system will log the error in an error log. The entries in this log can then later on be resolved and the remaining supply plan be calculated.

- Planning Resiliency - The planning batch job (report 99001017) has been made fault tolerant. you can let the batch job log errors in an error log instead of stopping the execution. The error log can then be retrieved for resolution.
- Carry Out Action Msg. Resiliency - The carry out action message batch job (report 99001020) has been made fault tolerant. You can now let the batch job continue even if it is not possible to carry out an action message for one or more planning lines.
- Prevent uncritical acceptance of suspicious action messages - Accept action message is set to No when the message is related to a released purchase or production order or the starting date is before the working date.

## 6010 Basic Capacity Planning

### Manual Planning

This feature is a simple supply planning tool that functions as a manual MRP system, where the user makes planning decisions order-by-order based on visibility and manual planning functions. The Order Planning feature uses parts of the existing planning engine to find and analyze new demand but it does not consider planning parameters defined for the items and is therefore much more transparent than the automatic system.

The Order Planning window displays all new demand along with advanced availability information and suggestions for supply. It provides the visibility and tools needed to manually plan for demand from both sales lines and component lines and then create different types of supply orders directly. It requires that a Planner deals with demand level-by-level. That is, any dependent demand for lower-level production items is only visible to the system after the higher level is planned. The Order Planning feature includes functions to supply from alternative sources, to easily create different supply orders and to quickly recalculate new demand.

## 6040 Production Schedule

### Graphical Production Schedule

This feature provides a graphical representation of production orders and capacity loading in an integrated Gantt component. The Production Schedule window is a Gantt chart that is fully integrated with Microsoft Dynamics NAV and allows a user to reschedule operations by drag and drop in a graphical interface and thus update the related production order data. The feature does not provide new scheduling functionality – it merely enables in a graphical interface the tasks otherwise done in tabular form in routings, task lists, load windows, etc. As such, it is a consolidation of existing data and functions for capacity planning and scheduling in one graphical interface, which provides a much improved overview and simplicity of use for different user roles.

You must purchase Granule 6010 Basic Capacity Planning before you can use this granule.

## **E-Commerce**

### **6810 Employee Portal**

With Employee Portal for Microsoft Dynamics NAV, we have integrated to both Windows SharePoint® Services and the SharePoint® Portal Server. Employee Portal for Microsoft Dynamics NAV provides a Web-based access to real-time enterprise resource planning based on data for employees and partners via a known Microsoft Web platform. The solution has functionality similar to the discontinued User Portal.

The main benefit of having an intranet portal offering is to broaden the footprint of the Microsoft Dynamics NAV application. Instead of having to use the standard Microsoft Dynamics NAV client to view, modify, or create data in Microsoft Dynamics NAV, it will now be possible to do these tasks using an application that resides on all desktops—the Internet Explorer. This enables a broader range of users to work with Microsoft Dynamics NAV data and reduces the amount of time it takes to learn to read and update data.

The solution is a toolkit that makes Microsoft Dynamics NAV data and business logic available in SharePoint. By toolkit we emphasize that the Microsoft Dynamics NAV Employee Portal will not be a complete readymade portal but rather a framework to present and update data via Microsoft SharePoint.

The toolkit comes with three generic Web parts:

- List Web part for displaying data in a tabular manner, such as a customer list.
- Card Web part for displaying details about a record in a card-like manner such as a Customer card.
- Header-line Web part for displaying items with both header and line information such as a quote.

Furthermore it will be possible to connect the various Web parts as well as display reports and run custom code.

When you install Microsoft Dynamics NAV Employee Portal, an optional sample application will be made available to you. This sample application can be used for inspiration and demonstration purposes. The sample application is not meant to be an “out-of-the-box” template for partners to implement at customer sites.

### **99008510 Commerce Gateway**

- Support for latest version of BizTalk® Server (BizTalk Server 2004).
- Enhanced security with optional encrypted communication.
- Accepting and sending of multiple documents.

## **Business Notifications**

### **7010 Business Notifications**

Business Notifications is functionality within Microsoft Dynamics NAV that gives customers the ability to automatically send notifications and alerts both internally in the company and externally to business partners. These alerts and notifications are sent via emails, based on business rules, determined by the customer’s business needs and set up within their Microsoft Dynamics NAV solution.

## 7011 Business Notification Worksheet

The Business Notification Worksheet enables customers to run events in periodic batches. The granule also includes the following six out-of-the-box event templates that cover and solve problems around the supply chain business processes:

- Purchase order - Ensure delivery of goods
- Purchase order - Vendor confirmation not received
- Purchase order - goods not received from vendor
- Production order - Production delayed
- Inventory - Item quantity status
- Production BOM, and Production BOM version – Items updated

## ***Business Analytics***

Business Analytics for Microsoft Dynamics NAV provides a new analytical tool to the Microsoft Dynamics NAV offering. This new easy-to-use tool will enable users to leverage the data stored within Microsoft Dynamics NAV. The main benefits of the Business Analytics solution are:

- Ease of Analysis - This is obtained by integration with Excel which has been the de-facto data analysis tool for the majority of business users, or by using the Business Analytics front-end solution.
- Ease of Configuration - The configuration of OLAP cubes and the supporting infrastructure for data extraction and storage has been one of the biggest impediments for the mid-market customers to reap the benefits of analytics technology. Customers are able to configure the data that they want to analyze from within Microsoft Dynamics NAV itself using their knowledge of Microsoft Dynamics NAV.

Both Basic and Advanced Business Analytics run on SQL 2000 and SQL 2005.

## 7020 Business Analytics – Basic

The basic offering enables customers to analyze data from different application areas within Microsoft Dynamics NAV. It includes:

- A set of forms within Microsoft Dynamics NAV for configuration of dimensions and measures.
- A configuration engine that configures DTS packages for data transfer and schema for OLAP cubes and data mart tables.

Customers can view and analyze data through Microsoft Excel via the OLAP cubes.

Note the Microsoft Dynamics NAV 5.0 CD includes the definition of the OLAP cubes but to create the cubes you need to download the configurator from PartnerSource.

Business Analytics in version 5.0 includes:

- Filters that allow customers with large volumes of data to run on subsets of data. Filtering can be done on any of the dimensions used in a cube:
  - A date/time interval
  - A set of accounts
  - A set of customers

- Calculations between virtual cubes that allow for cross-cube calculations to be handled by BA Basic. Given a cube with actual sales and budgeted sales, Business Analytics can calculate budget deviations, forecasts, and deviations between them.
- Multiple active configurations that allow us to have configurations that need to be updated with different frequencies. Budgets tend to change less frequently than actual sales
- Support for Instances of SQL Server and Analysis Services that allows for more complex server topologies at customers and maybe even hosted scenarios
- *Freehand MDX* with multidimensional eXpressions (MDX). MDX is the query and calculation language of Analysis Services that allows for very complex calculations to be stored in cubes created by BA for
  - Calculating Commission
  - KPIs for Scorecards or Dashboards
  - Calculations across multiple dimensions where navigating multidimensional data is key

## 7021 Business Analytics – Advanced

The advanced offering includes all the features of the basic offering plus a front-end solution designed specifically for core small businesses and lower mid-market companies to enable targeted analysis of detailed information generated from Microsoft Dynamics NAV. Microsoft Dynamics NAV Business Analytics makes it possible to gain a 360-degree view of your business performance.

Microsoft Dynamics NAV Business Analytics not only generates a quick overview of your core business data the way you want it presented, it also ensures that everyone in your organization is using the same up-to-date data for gaining business insights to make strategic and operational decisions.

The Advanced offering will also be included on the specific Business Analytics CD.

## **Technology Enhancements**

### Office Look Navigation Pane replaces Main Menu

We have introduced a Navigation Pane similar to the one in Microsoft Office Outlook 2003 and 2007. The new Navigation Pane helps users work more efficiently in Microsoft Dynamics NAV by combining easy-to-access menu information with personalization options. Further, users with administrator permissions for the Navigation Pane have various menu configuration options. Here are some of the main benefits:

- Customer license file and security permissions automatically determine the menus shown and the items shown within each menu.
- The content of the main menu has been restructured to reflect our end users' tasks and make it easier for them to find the functionality they need.
- End users can personalize menu content to suit the way they work. For example, they can hide menu items that they do not use very often.
- End users can make shortcuts to the menu items that they use the most and also to all the files, programs and Web sites that they use in their daily work.

Administrator users can be granted access to the Navigation Pane Designer:

- Administrators can create and modify menus to best suit their companies' departmental needs.

- Administrators can assign users to menus so that end users only see menus that are relevant to their roles.

## Simple Bar Chart Graph Components

Predefined Key Performance Indicators (KPIs) can be viewed in a generic graph component in Microsoft Dynamics NAV that can be customized by partners. The predefined KPIs represent Financial Management, Supply Chain Management and CRM. The graph component enables users to create a simple bar chart diagram consisting of a limited number of squares and the ability of drilling down. The graph can be generic and customized by partners.

## 1700 C/ODBC

Microsoft Dynamics NAV 5.0 includes a new ODBC driver. The ODBC driver for Microsoft Dynamics NAV 5.0 supports conformance level 2 and supports the majority of the business intelligence tools on the market.

The new ODBC driver is built on top of C/Front which will be embedded within the ODBC driver. **The C/Front granule is not required to run the new ODBC driver.**

## 1800 C/FRONT

The C/FRONT for Microsoft Dynamics NAV includes a dynamic link library that gives developers the chance to read data from and write data to Microsoft Dynamics NAV from an external application. The C/FRONT .NET dynamic link library enables the development of the external application to be done from any of the .NET languages such as C# or VB .NET.

The .NET dll is not a complete .NET data adapter but does offer all the functions that were available from the existing C/FRONT dll. All functions have revised Help including tooltips and are coded in a single base class with namespace Microsoft.Navision.CFront.

Included in 5.0 are the following improvements:

- Addressed quality issues in the C++ CFront dll
- New COM interop wrapper to provide a .NET CFront dll
- Addressed quality issues in the CFront OCX sample
- New Visual Studio C# project to show usage of the CFront functions
- Documentation of existing CFront functions that were previously undocumented

## 2010 Microsoft SQL Server Option

Performance Optimization - We have made some general performance improvements in Microsoft SQL Server Option for Microsoft Dynamics NAV 4.0 SP1. Due to these improvements, we recommend existing customers using the SQL Server option for Microsoft Dynamics NAV 2.60 and newer to upgrade to C/SIDE 5.0.

- C/SIDE tools that can be used in customer installations to solve specific customer performance problems. The goal of these improvements is to produce a more SQL-aware standard application and to empower solution developers to tune customizations against SQL Server, while continuing to support the Microsoft Dynamics NAV Server and maintain a single code base.

- Introduce new C/AL functions to make FIND more efficient - provides the optimal SQL queries for traversing forward through a set of records (also available through C/FRONT). A non-cursor query that is faster and consumes less server resources (fire hose) can be used (provided that the set size is small).
- New Database Options - Allowing SQL Server to determine the best lock granularity (table, page, or rowlocks) as opposed to always overriding with rowlocks, makes for more efficient use of server resources. Introducing a lock timeout will improve the user experience because the client will not be left hanging while other users are blocking tables for long periods. This will also cut away peaks from the server and smooth out the workload.
- Create alternative SQL indexes to the keys defined by the application - Introduce a new key property 'SQL Index' that allows the field sequence of the SQL index for a particular Microsoft Dynamics NAV key to be specified explicitly. As a result, Read performance problems due to inefficient SQL indexes can be avoided, especially with regard to the cardinality of fields at the beginning of an index.
- Introduce a clustered property on keys - Introduce a 'clustered' key property to allow a key to be nominated as the clustered key, rather than always defaulting to the primary key. As a result, Read performance can be improved in situations where the primary key is not a good candidate for clustering since it is not present in filters.
- SQL implementation of SIFT indexes improved - The SQL implementation of SIFT indexes has been modified to improve the performance of update and delete operations, by reducing the overall number of update statements executed by SQL. This has the effect of reducing the overall time required to execute the operation, and also reducing the possibility of contention with other concurrent users. While this change has the greatest impact on multi row updates, it also improves the performance of a single row update.

## 7140 XML Port Designer, 8700 XML Ports (Each) and 8750 XML Ports (100)

A new XML Port feature makes it easier for partners to customize Microsoft Dynamics NAV. The XML port improves the overall performance of Microsoft Dynamics NAV when handling document exchange, and reduces the need for partners to have expert knowledge of XML parsers. Partners can develop, implement and manage XML documents in an efficient and cost effective way, and customers can more easily manage data exchange of business documents.

## ***Discontinued Functionality***

### 1540 and 1610 IBM AIX and IBM iSeries

These granules have been discontinued.

### 5200 Smart Tags

This granule has been removed.

### 6210, 6220 Commerce Portal

The Commerce Portal granules have been removed.

### 6710, 6750 and 6760 User Portal

These granules have been discontinued.

---

## Company Notes

The Company Notes feature has been discontinued.

Microsoft Dynamics is a line of integrated, adaptable business management solutions that enables you and your people to make business decisions with greater confidence. Microsoft Dynamics works like and with familiar Microsoft software, automating and streamlining financial, customer relationship and supply chain processes in a way that helps you drive business success.
